Administrative details

- Your sources shall be turned-in on the `PSU_year_myscript` directory
ex : `PSU_2013_myscript` for the 2013-2014 solar year
- Your binaries shall be compiled by one (and only one!) Makefile.
- Your binaries shall be named `my_script`.
- This project has to be achieved alone.

Pay attention to the permissions of your files and directories

Subject

- The goal of this project is to realize an equivalent of the command 'script' of the system, with its options.
- Your project "my_script" has to implement the options common of all the architectures, namely :
 - -a option
 - Option to specify an output file.
- The other options 'may' give rise to bonus.

Some options could also be deemed too easy and be ignored.

- The man explains in detail the operation of the command `script`

Indices

It is strongly advised to test the system command for a perfect understanding of its operation

Indices

Execute the command `tty` before and after the script command

Forbidden functions

- forkpty
- openpty
- login_tty
- posix_openpt
- grantpt
- unlockpt
- ptsname

Allowed functions

- the C library minus the forbidden functions.
